

How Tap&Go lets riders pay for a bus ride with a single tap

This explains what Tap&Go is, why it exists, and exactly what happens when a rider uses it.

The idea, in one sentence

Instead of paying cash for every short bus ride, a rider loads money onto a card once, then just taps it against a reader to get on the bus — the fare comes out automatically.

Why this matters

The problem it solves, the fix, and how far along it is today.

THE PROBLEM

Cash slows everyone down

City routes are quick, frequent trips. Fumbling for exact change every time is slow for the rider and the driver.

THE FIX

A rechargeable card

A rider registers a card once, tops it up with money whenever they like, then taps to board. No cash, no counting change.

WHERE IT STANDS

Working demo today

The full experience — registering, topping up, tapping in and out — already works in the app. It's not yet connected to a real card reader or bank, but

everything a rider would see and do is built.

The rider's journey

What actually happens, from getting a card to finishing a trip.

1

Get a card

The rider types in a card number to link it to their account. A brand-new card starts with 1,500 RWF already on it, so it's ready to use right away.

2

Check the balance

The app shows a green card with the current balance and the card's ID, so the rider always knows how much money they have.

3

Add more money

Whenever the balance is running low, the rider picks an amount and a way to pay: an agent, MoMo, Airtel Money, or a bank. The money is added to the card immediately.

4

Choose a route

The rider picks which city route they're taking, so the app knows what the fare will be.

5

Tap to board

The rider taps their card at the reader. It briefly shows "detected," then confirms the fare and takes it straight out of the balance — the whole thing takes under two seconds.

6

Tap to get off

At the end of the ride, the rider taps again to close out the trip. This doesn't cost anything extra — it just records that the trip is finished.

If the balance is too low: the app won't let the rider board. Instead of taking a partial payment, it shows a clear "insufficient balance" message so the rider knows to top up first.

Every transaction is recorded

Nothing happens quietly. Every time money moves — a top-up, a ride, an exit — it's written down on the card's history, newest first, so a rider (or Gerayo) can always see exactly where the money went.

Ways to add money

- Agent
- Mobile Money (MoMo)
- Airtel Money
- Bank

A rider can also manage more than one card — switch between them, give them nicknames, or remove one they no longer use. A removed card isn't erased; if the rider ever adds it back, its balance and history come right back.

What's real today vs. what comes next

WORKS TODAY

- Registering a card
- Viewing balance and history
- Topping up (simulated payment)
- Tapping to board and exit
- Managing multiple cards

NEEDED TO GO LIVE

- A real card reader on buses
- Connecting top-ups to real MoMo / Airtel / bank payments
- Storing balances centrally, so they don't disappear if a rider switches phones
